

Diagnostic and Monitoring Technologies

The Honeycomb-Principle –
a modular approach.

Manfred Arndt

Digital Transformation – Evolution or Revolution?

Railways need to be competitive!

- Essential target: **Competitiveness** as a means of transport!
- Digital transformation appears as an opportunity to increase efficiency in organizational processes.
- Diagnostic and Monitoring Technology will be of decisive importance to improve **safety, availability and efficiency** of railway operations!
- Diagnostic and Monitoring Technology is an essential prerequisite in successful **asset management**.
- BUT: What are the obstacles in the future path of DMT?

Are we prisoners of our History?

- Railways have a history of almost 200 years
- Some things have not changed at all – like rail gauge
- Some things might change to slow...

Economical and Organisational Resistance to Change

- Significant historical investments in existing technology
with long life cycles: e.g. a rail car ≥ 50 years
- Security reasons
 - Protection of IT networks (e.g. difficulty to offer remote maintenance)
 - Complexity of homologation for DMT
- Organization
 - Stability of historical organizational structures (grown over 200 years)
 - Political influence; Unions; official bodies, like EBA, etc.
 - „Lock-In“ situations for several organizational reasons:
e.g. the fear to lose position or power...

Technological Resistance to Change

- Classic Diagnostic and Monitoring Technologies have their historical origin in different railway departments and therefore promoting heterogeneous developments.
- System manufacturers have developed independent system solutions which are based on different hardware- and software architectures resulting in Expensive Monolithic System Design and Proprietary Interfaces and Protocols.
- Existing data are often stored in independent and incompatible data bases.
- Only a few railway organisations are able to identify measurement data by tagging systems (RFID) in order to combine and correlate data.
- Individual communication protocols interfere with the integration of data into a common data base thus creating high level information on an superior diagnostic platform.

RESULT:

1. High Cost for Operators and Suppliers
2. Low Motivation to Change

3. Forget about Asset Management?

How to create a new path in DMT?

To overcome existing obstacles
and to create a new path in DMT we need to be:

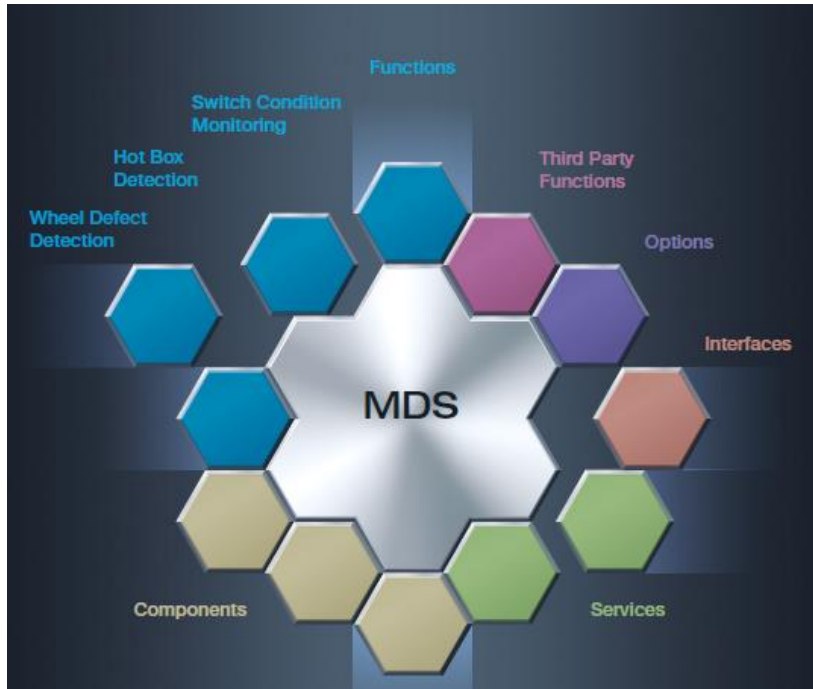

- Open
- Flexible
- Cost Effective
- Standardized

PHOENIX^{CMS/MDS} – a Catalyst for Digital Transformation

- Modular and cost-effective architecture of monitoring systems
- Standard interfaces and protocols
- Flexible implementation of APPs and Functions

ONE STEP AHEAD.

PHOENIX^{CMS} - Central Management Software

- Integration of Wayside Monitoring Systems
- Web Based Interface
- APPs for Diagnosis and Management of Rolling Stock and Fixed Assets
- Open System Architecture allows Third Party APPs
- Open Protocols
e.g. OPC-UA (IEC 62541)

Alarming and Intervention

- Trending alarm
- Customized alarm levels
- Recommended alarm intervention
- Identified user acknowledgement
- Alarm filtering based on user roles

Asset Management

- Customized dashboards on key performance indicators
- Automatic report generation
- Interfacing for supply chain
- Asset performance trending

Condition Based Maintenance

Central Management Software

SCM Switch Condition Monitoring

Details	Component	Status/Description
!	ECOSTAR Berlin	Maintenance Warning: Hand running in movement section

Instruction

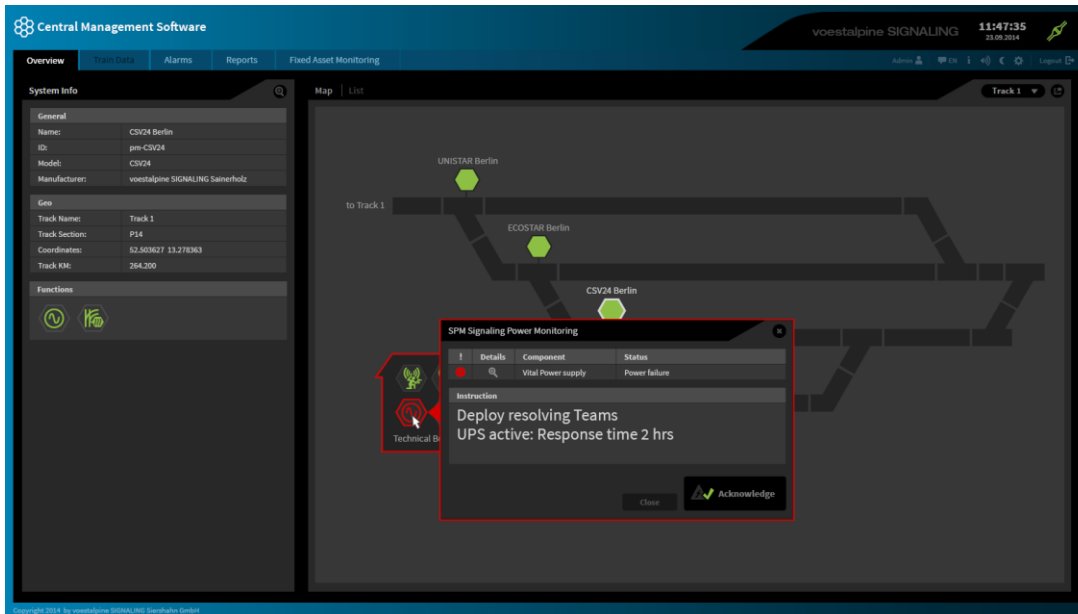

Prioritize maintenance inspection.

Close Acknowledge

- Predictive asset diagnosis
- Direct insight into asset status
- Work order and part list generation
- Preventive and corrective maintenance scheduling

System Supervision

- Health and status monitoring
- Insight into system performance
- Troubleshooting support
- Mobile device GUI

Thank you!

Economies by Nature
